

MACTECH BIPOD DRILL

MACTECH PORTABLE MACHINING SOLUTIONS

Using our "BiPod" drill we offer a multitude of services for adding new holes or reworking defective or leaking holes. In drums we are able to back bore clearance for expanding tubes and/or add serration grooves for tube rolling. We can perform radial, non-radial, inside, or outside drilling. In headers we can add new holes with seats and weld prep.

Drilling new holes in drums or headers is made easy with our setup. A pilot hole is drilled and then a hole saw finishes the cut. We are able to cut virtually any size in drums and headers with this application.
