

# MACTECH HAND HOLE RESURFACING

## MACTECH PORTABLE MACHINING SOLUTIONS

Mactech has an expanded range of hand hole applications. We reface, install and convert elliptical, round, diamond and square hand holes. Our equipment refinishes gasket seats in headers for hand hole caps to like-new condition.

### Eliminate welding of hand hole caps to prevent leakage!

The gasket seats in headers for hand hole caps can be refinished to new condition by using our oval seat refacing hand hole machines. We can work on oval, round, diamond, and square holes in a range of sizes. In addition we can also install new holes or change configurations of existing holes.

The hand hole cap is removed by drilling the cap and weld simultaneously, allowing the cap to fall free. This eliminates the need to grind or torch cut the cap, which may damage the hole. The machines may be set up in virtually any position. Approximately 20" of clearance is needed to mount the equipment.

### Capabilities:

Refacing, Installation,  
Conversion:

- Elliptical
- Round
- Diamond
- Square
